Welcome to your new F18 Landing Panel!

Just a few things, currently by default the unit comes as a DCSBIOS device. If you are not familiar with DCSBIOS please check out the following link

<https://dcs-bios.readthedocs.io/en/latest/installation.html>

The Repository to use is

<https://github.com/tekcreations/TekF18>

If you wish to have this unit as a HID device, this can be achieved by pushing the Flaps Switch to Full (Bottom Position), Holding the Warn Tone Sil Button down and flicking Flaps all the way to the Top AUTO in one Push.

The unit will flash and then function as a USB HID Joystick Controller. **Please note**, this may not appear in Game Controllers, but this will work perfectly fine for any game and will require mapping to be done in most games.

If you wish to switch back to DCSBIOS Mode this can be achieved by pushing the Flaps Switch to Auto (Top Position), Holding the Warn Tone Sil Button down and flicking Flaps all the way to the Bottom FULL in one Push.

Please note the landing gear light will not work in HID mode.

In DCSBIOS mode, When the landing gear is in the “middle” position, if you push both Warn Tone and DN Lock simultaneously this will toggle the Gear Rotate function.

The Backlit Brightness is controlled by the Consoles Rotary.

HAPPY FLYING!

Kieron - Tek Creations
